REQUIREMENTS

The GreenGrocer™ is a grocery shopping application that allows users to browse different product categories, view product details, and manage their shopping carts using real-time data

User Types

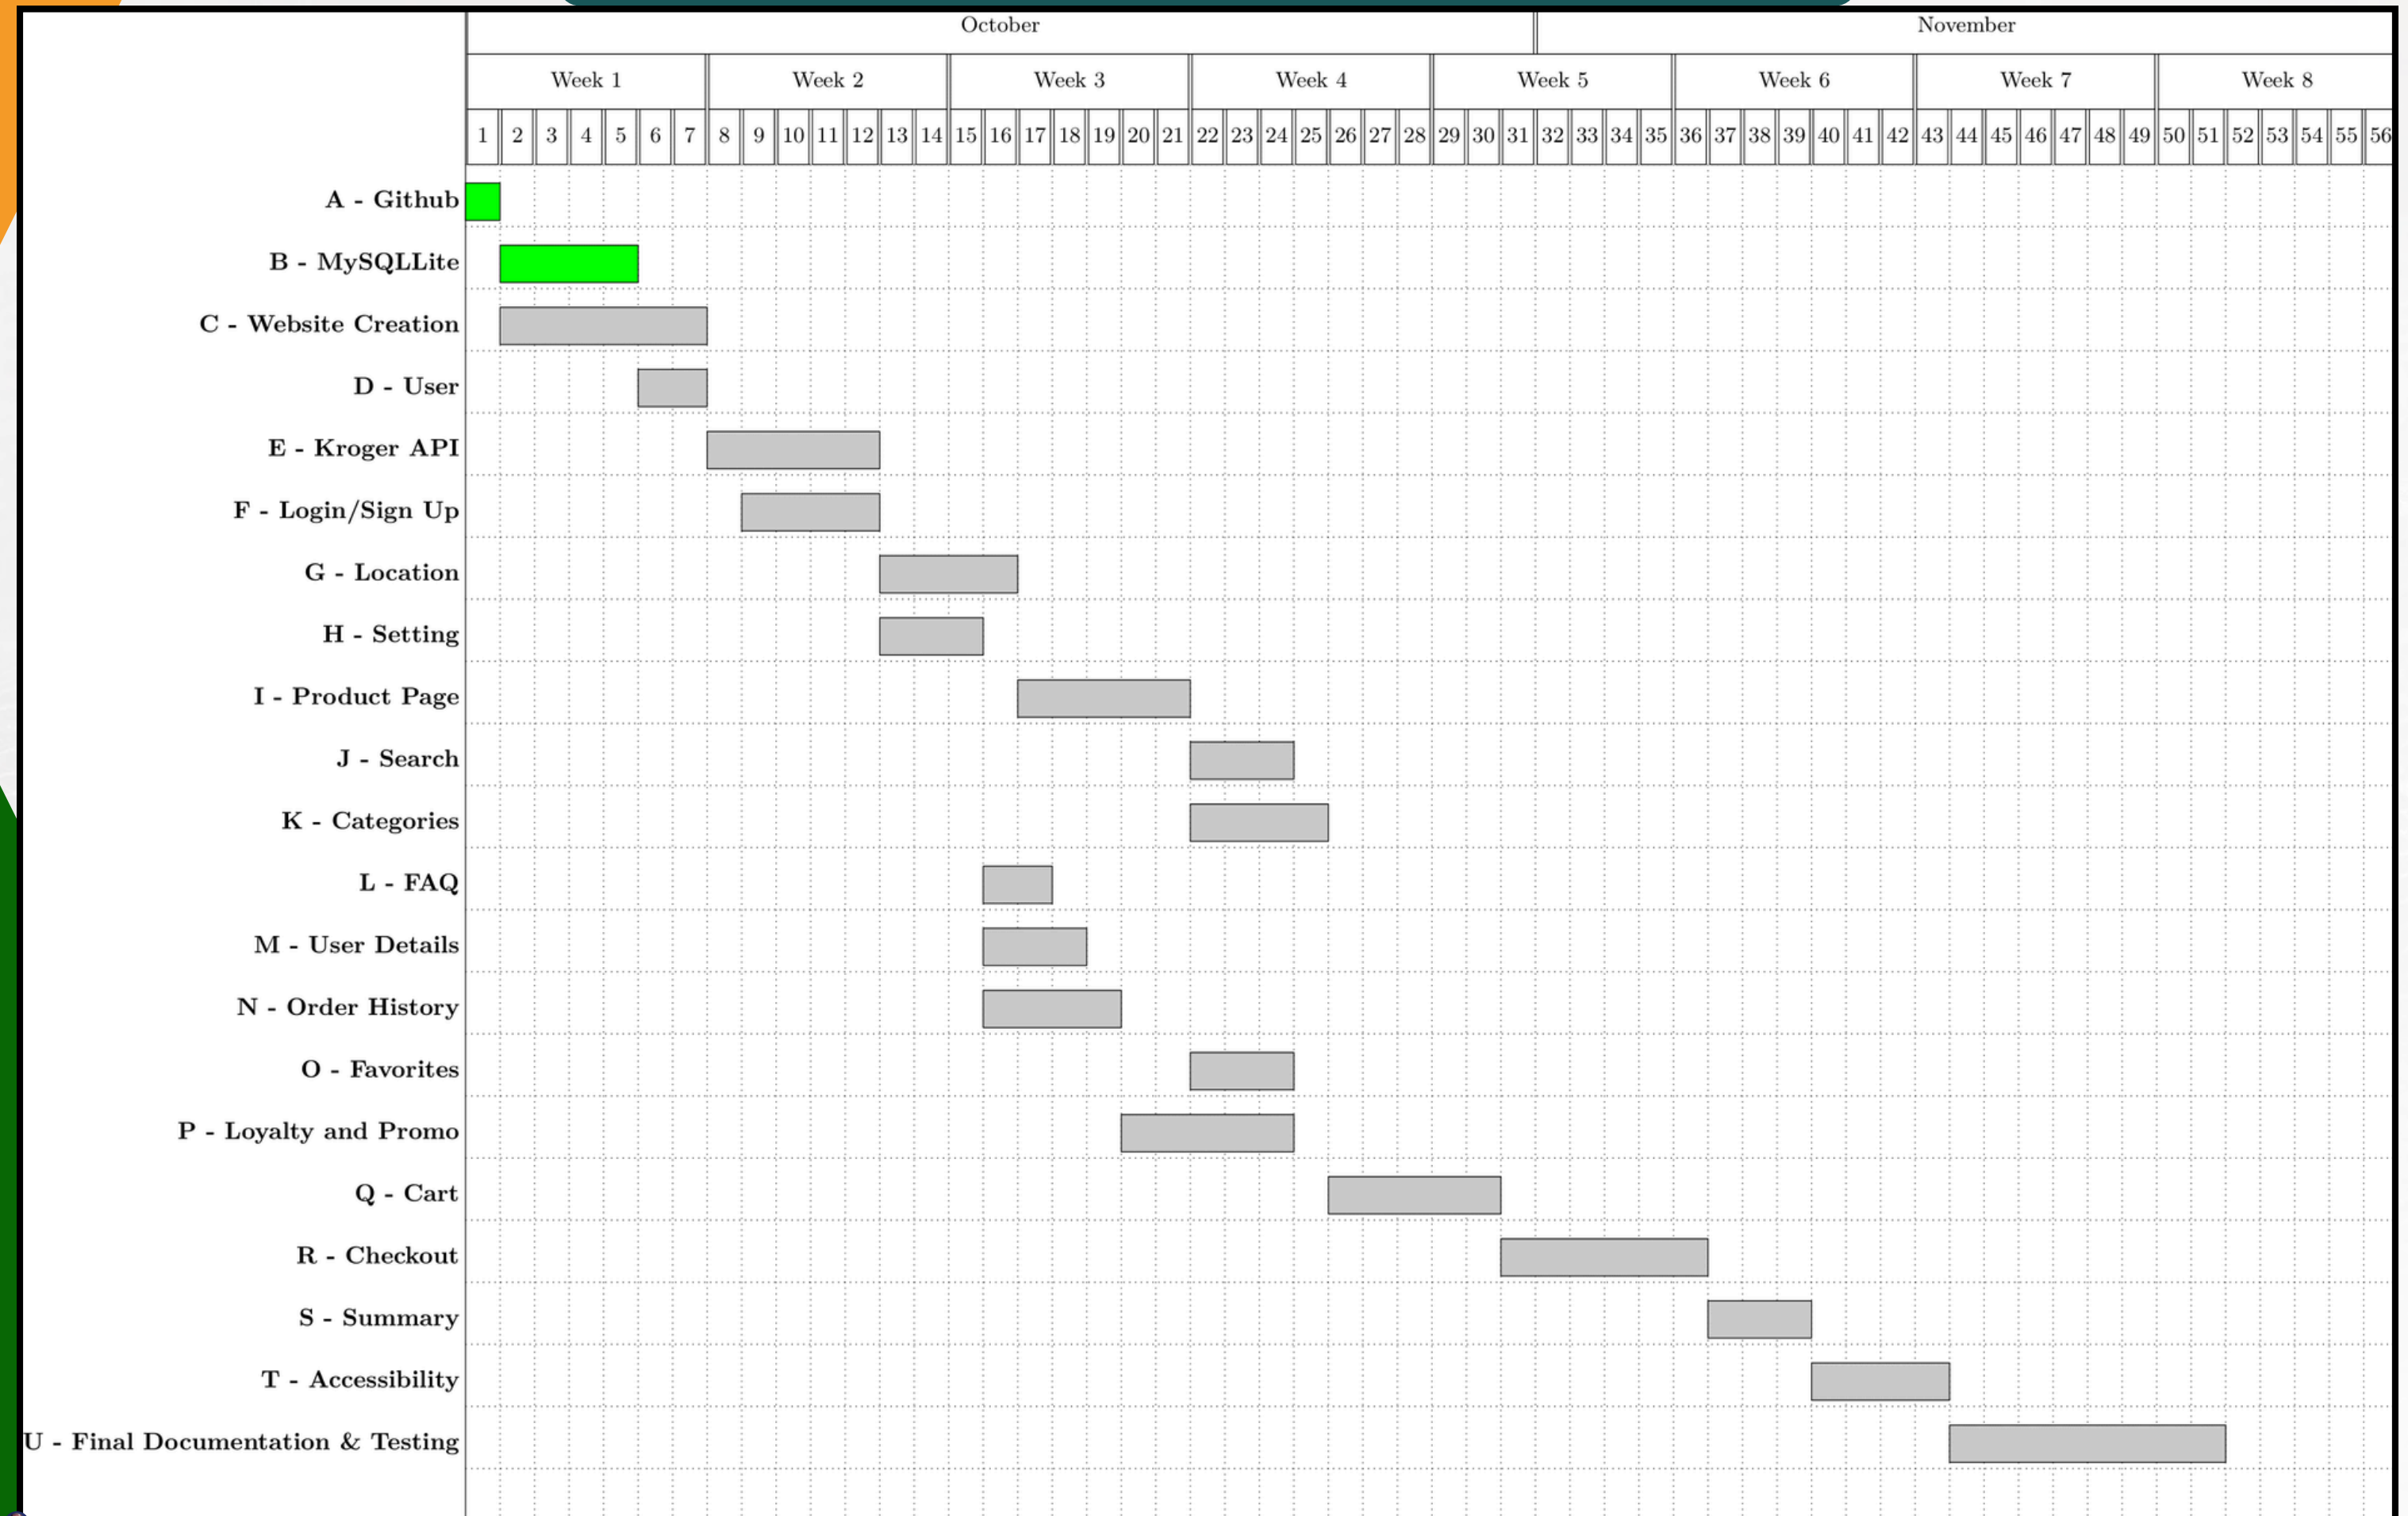

- Guest
 - Users can browse through a collection of items and make purchases without creating an account
 - Cannot access certain features
- Unregistered user
 - Users who plan on registering and creating an account
- Registered User
 - Returning users who have previously created and logged into their accounts
 - Access to all features

Features & Functionalities

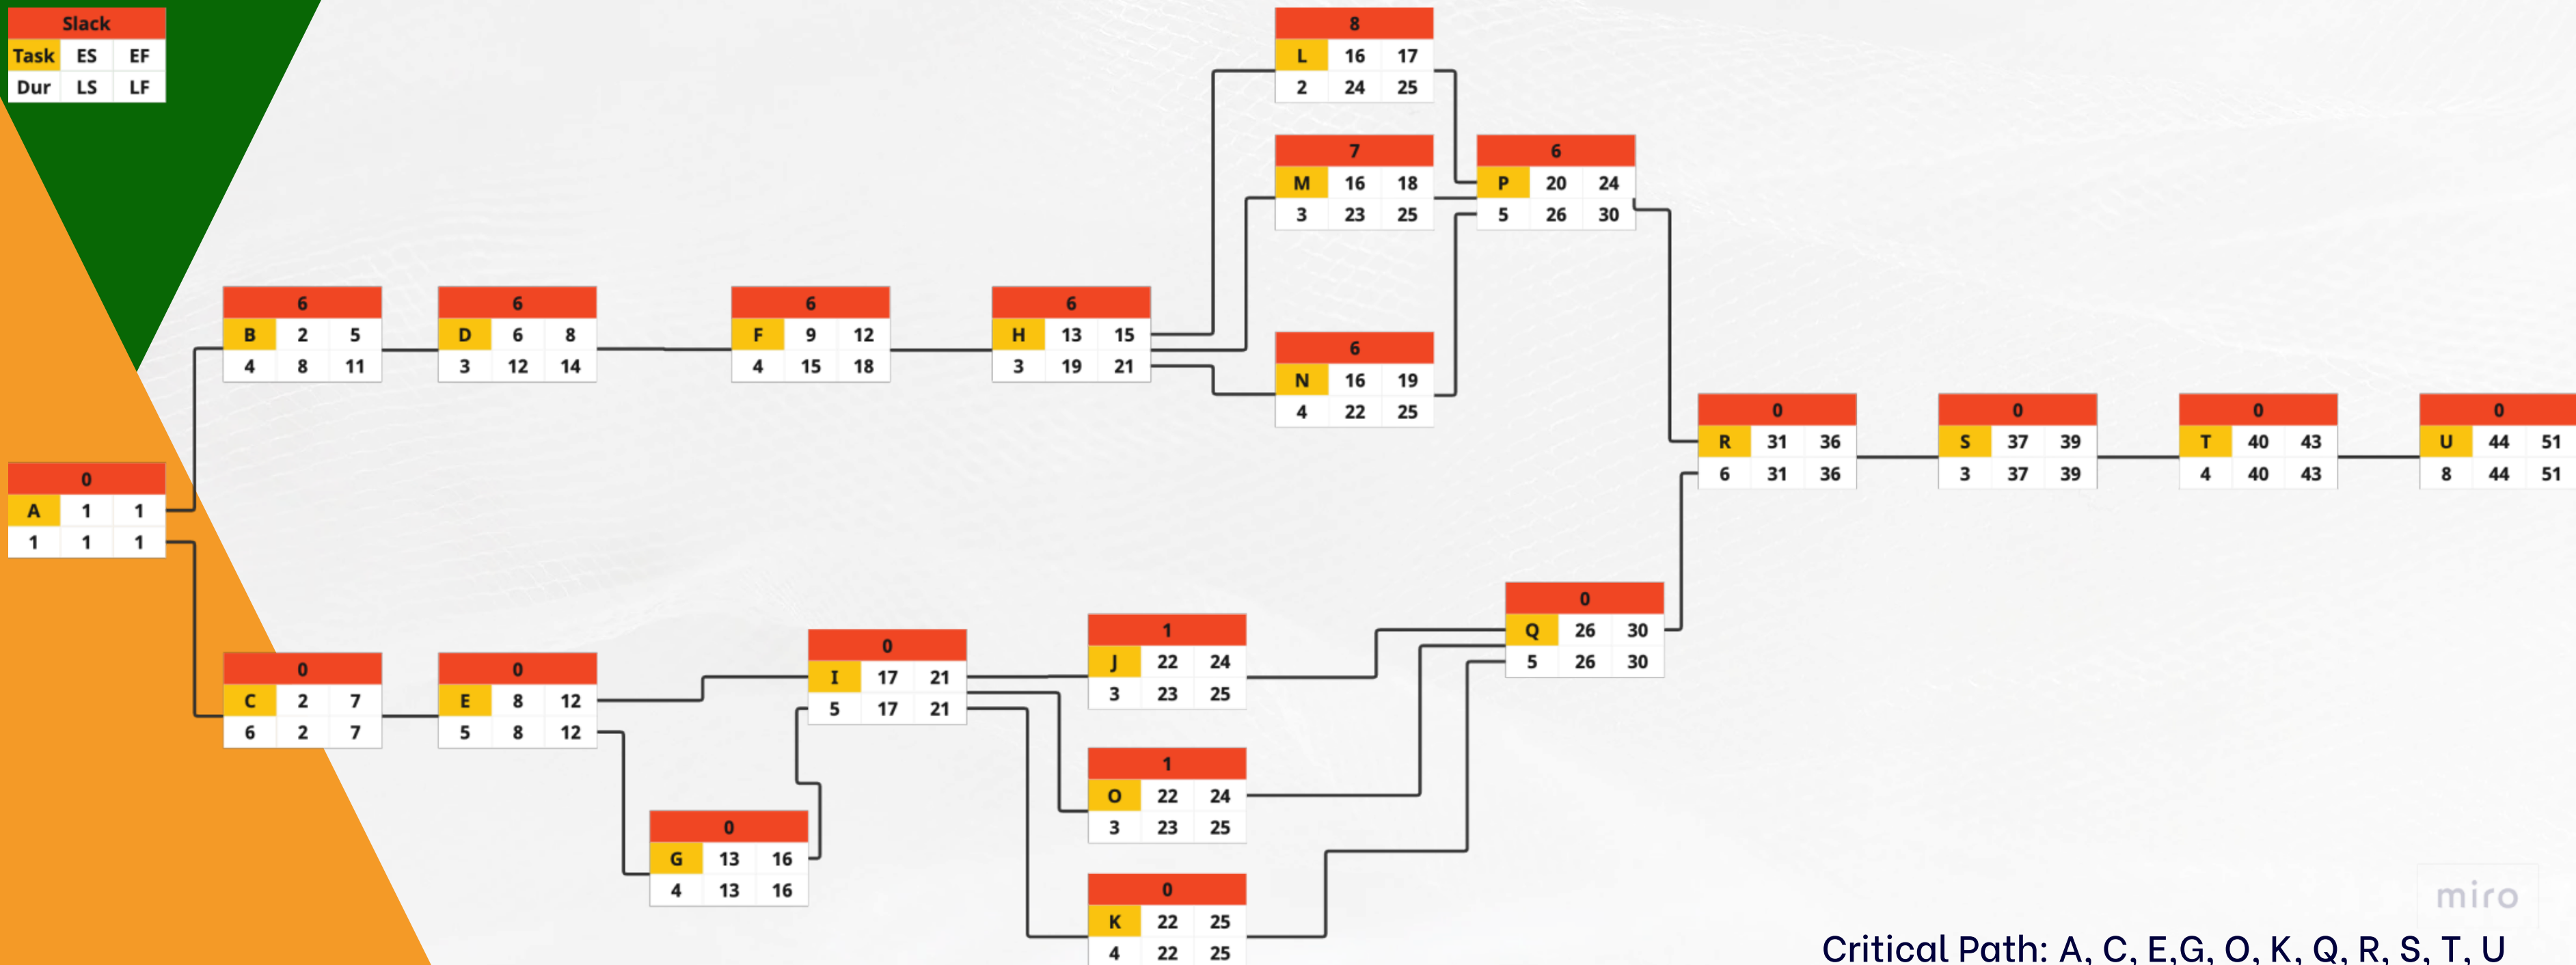

- User Authentication and Registry
- Home Page
- Account Management
- Location Management
- Product Categories
- Product Search
- Checkout
- Order Summary
- Loyalty, Rewards, and Promotions
- Accessibility

Critical Path: A, C, E, I, Q, R, H, N, P, T, U

PROJECT RISKS AND SOLUTIONS

ITEMS DISPLAYED

- **Problem:** Displaying a large number of items led to significant performance slowdowns.
- **Solution:** Implemented a counter to limit number of API products being displayed, improving performance and keeping engagement.

PRICING DISPLAY ISSUES

- **Problem:** Product pricing was not viewable due to location-based zone bounding
- **Solution:** Backend logic was updated to account for a singular location so the prices were limited to that particular location.

LINKING CART WITH USER ACCOUNTS

- **Problem:** At the start of the development process, we encountered issues where the cart contents would not persist across sessions or devices.
- **Solution:** For registered accounts, link the cart details to a JSON file so they can pick up where they left off

SEARCH BAR

- **Problem:** Limited search bar, only matching exact terms, difficulty finding products
- **Solution:** Directly “hard-code” most products to match search bar, need another solution that presents related products if searched one is not available

PROTOTYPE DEMONSTRATION

<http://127.0.0.1:5000/login>

The prototype of the application is available locally through the development environment. This local server allows access to all core features, such as user login, product browsing, cart functionality, and order history. By using this URL, developers and testers can assess the system's features and performance during its development phase once they have the code implementation on there system.
